

FOREWORD

This publication gives all the observations of rainfall taken in the main weather stations of the Philippines from the beginning of the Weather Bureau up to the end of 1933. The period covered by the stations varies from 2 years as at Argao, Cebu to 69 years as at Manila.

Each station is designated by its local name with the specification of the province and island to which the station belongs.

Using the average rainfall and mean number of rainy days, the annual distribution of precipitation and rainy days is represented by means of histograms.

The stations both in the numerical tables and in the charts are arranged according to increasing latitude.

For identification purposes, at the bottom of each numerical table a reference is made to the plate that represents the results; viceversa at the bottom of each plate a reference is made to the page that contains the numerical table.

This publication supersedes and supplements the latest rainfall observations which appeared in 1914.

MIGUEL SELGA, S. J.
Director, Weather Bureau
