

San Fernando, La Union
Aug. 21, 1937

The Director
Weather Bureau
Manila :

Sir :

Once more in the course of time was this station rocked by and earthquake which is by far not destructive. I felt the feeble shock at 8:57 PM of the 20 lasting about 10 seconds. The plane on which the objects swung was elliptical and the major axis is in the NE-SW line. There was however no noise heard and the earthquake was of a sudden. Then it was repeated with a very feeble shock at about 8:18 PM of the same date and in the same direction. No noise of what ever sort was heard even in the repeated shock. There was no damage whatever kind as the intensity was small enough. Upon inquiry from individuals the quake was getting stronger as one goes south so they say that the quake was stronger in the ~~south~~ southern regions. As to extent of damages wrought by the earthquake there was none of whatever sort as to information.

People were only startled as they were beginning to sleep when the shock began. *The repeated shock lasted about 7 seconds.*

Very Respectfully,
