

Arevalo, City of Iloilo
Feb. 23, 1941

The Rev. Father Miguel Sanga
Director, Weather Bureau
Manila, P.I.
(Thru channels)

Dear Rev. Father:

I am sending herewith a rough sketch of the location or whereabouts of the celestial body which had passed in transit, and became visible to the naked eye on the 2nd. instant of this month, known as the Paraskevopoulos comet.

From the foregoing ocular observation, its direction is toward the Northeast, and seemed to have negotiated the distance in the constellation of Lyrae, in almost a week, - after which nothing is known of its what or whereabouts, or when will it due to return.

Precisely, if I am not mistaken, it was in Los Angeles Times, about three or four years ago when I read an interesting perusal of two comets supposed to be in transit in the earth's (neighborhood) or atmosphere, and known as E-1 and E-2 comets, forecasted by the Mt. Wilson observatory.

Basing our belief from this forecast, it seemed apparent that not erlong, another comet will actually be visible in the neighborhood of the earth's atmosphere, not far from the place where the Paraskevopoulos comet was discovered. Encke's comet was officially forecasted last June, 1937. It will be supposed to return after three years of its transit, being the fastest in record. Mayhap, the casual observer will take it for a falling meteor; veryly call it Lycids, perhaps this coming April, unless it becomes as an established fact. On the other hand, the inference of Cunningham's comet,
