January 20, 1941

Manila Observatory
Padre Faura St.
Malate, Manila

Dear Sirs:

I am writing to you for some information in regards to the coming Cunningham comet which has been published in the papers and which will be at its brightest on the 26th. Could you please inform me as to the direction in which it will be visible to the naked eye and also what time of the night it is best seen. As I am interested in star study, I am very anxious to have a look at this comet as this is the only time that I will have the experience of seeing one in my life. I have read in the Free Press that it is somewhere between the constellation Cygnus and Lyra. In other paper I read that it will be seen near the constellation Sagittarius. Then one observer in Pagsanjan with a portable telescope said that he saw this comet near the constellation Sagitta on or about January 4.

I would like also to know how it may be arranged for some of us out here in the province to have a peek thru your telescope to see the beauty of the heavens in your observatory room. I have heard that some of my friends from Manila and Calocan have joined themselves in a group and have had the opportunity of looking thru your telescope and seeing for themselves the magnificence of the heavens.

Trusting that I may hear from you at your early convenience and thanking you for these favors, I am

Yours very truly,

M. M. Zamora
