

REPORT ON THE GEOLOGIC INVESTIGATION OF THE AREA  
IN THE BARRIO OF AD-ADAAN, PASUQUIN, ILOCOS  
NORTE PROVINCE, WHICH HAS BEEN REPORTED  
TO CONTAIN TECTITES

By

Juan S. Teves

LOCATION AND EXTENT

The area studied lies about 8 kilometers northeast of the town of Pasuquin, Ilocos Norte Province, in the Barrio of Ad-Adaan. It covers approximately one and a half square kilometers.

BRIEF PHYSIOGRAPHIC DESCRIPTION

This region lies between the coastal plain of Ilocos and the Cordillera Central. It forms a part of an extensive plateau of limestone which is well dissected by creeks and rivers which empty into the China Sea. Some of the valleys formed and particularly that of the Alañigigan Creek, which is in the area under consideration, are still young. The valley walls are steep giving at first the impression of a volcanic crater, but upon close examination one dismisses right away the idea.
