Carrara, Tagabas

Feb. 27, 1938

Rev. Father Miguel Selga
Director, Weather Bureau
Manila

My Dear Rev. Father:

I received your letter ~~of~~ dated Feb. 21st wherein you asked several questions relative to the earthquake of August 20, 1937.

From my own observations and from the observations of the people around this locality which I have solicited during these few days, I have the following answers to give:

1. During the next fifteen days after the earthquake, contrary to the people's belief, there was not any extraordinary falling of small coconuts.

2. During the months of December and February the productions have reduced, but such reduction could not have been caused by the earthquake, because it has always been that after August of every year the production decreases.

3. The strong winds that have passed this locality might have affected the production a little.

I think this is so much I can inform you and I hope that I may be still be of help in the near future.

Sincerely yours,

Mariano Barretto
